Aim: Develop an approach to convert and upscale line-of-sight magnetic field data to a reference survey in order to understand long-term variability of the magnetic field on time-scales larger than the lifespan of a single instrument.

a Data Pre-Processing

1. Standardize the Sun's orientation and distance from the detector such that the solar radius is constant over time
2. Register & shift individual 128" x 128" patches (see inset regions, Figure 1) to account for orbital differences.

b Neural Network Architecture

We use an Encoder-Decoder architecture based on High-Res-Net (see, github.com/ElementAI/HighRes-net). The trained Neural Network (NN) output is shown in Figure 2.

c Loss Functions & Metrics

To train our supervised NN, we include a range of terms alongside MSE (mean-squared-error) loss, and evaluate on additional performance metrics.

1. Loss Functions

Histogram: The magnetic field distribution is non-Gaussian; by implementing a *differentiable* histogram, we better preserve the observed distribution of magnetic field.

Structural Similarity Metric (SSIM): Measure the perceived similarity between images.

Gradients: Preserve the gradients of the magnetic field.

2. Performance Metrics

Information Entropy: To understand the informational content of the output over all spatial scales, and to diagnose hallucination in the NN.

d Error Estimation

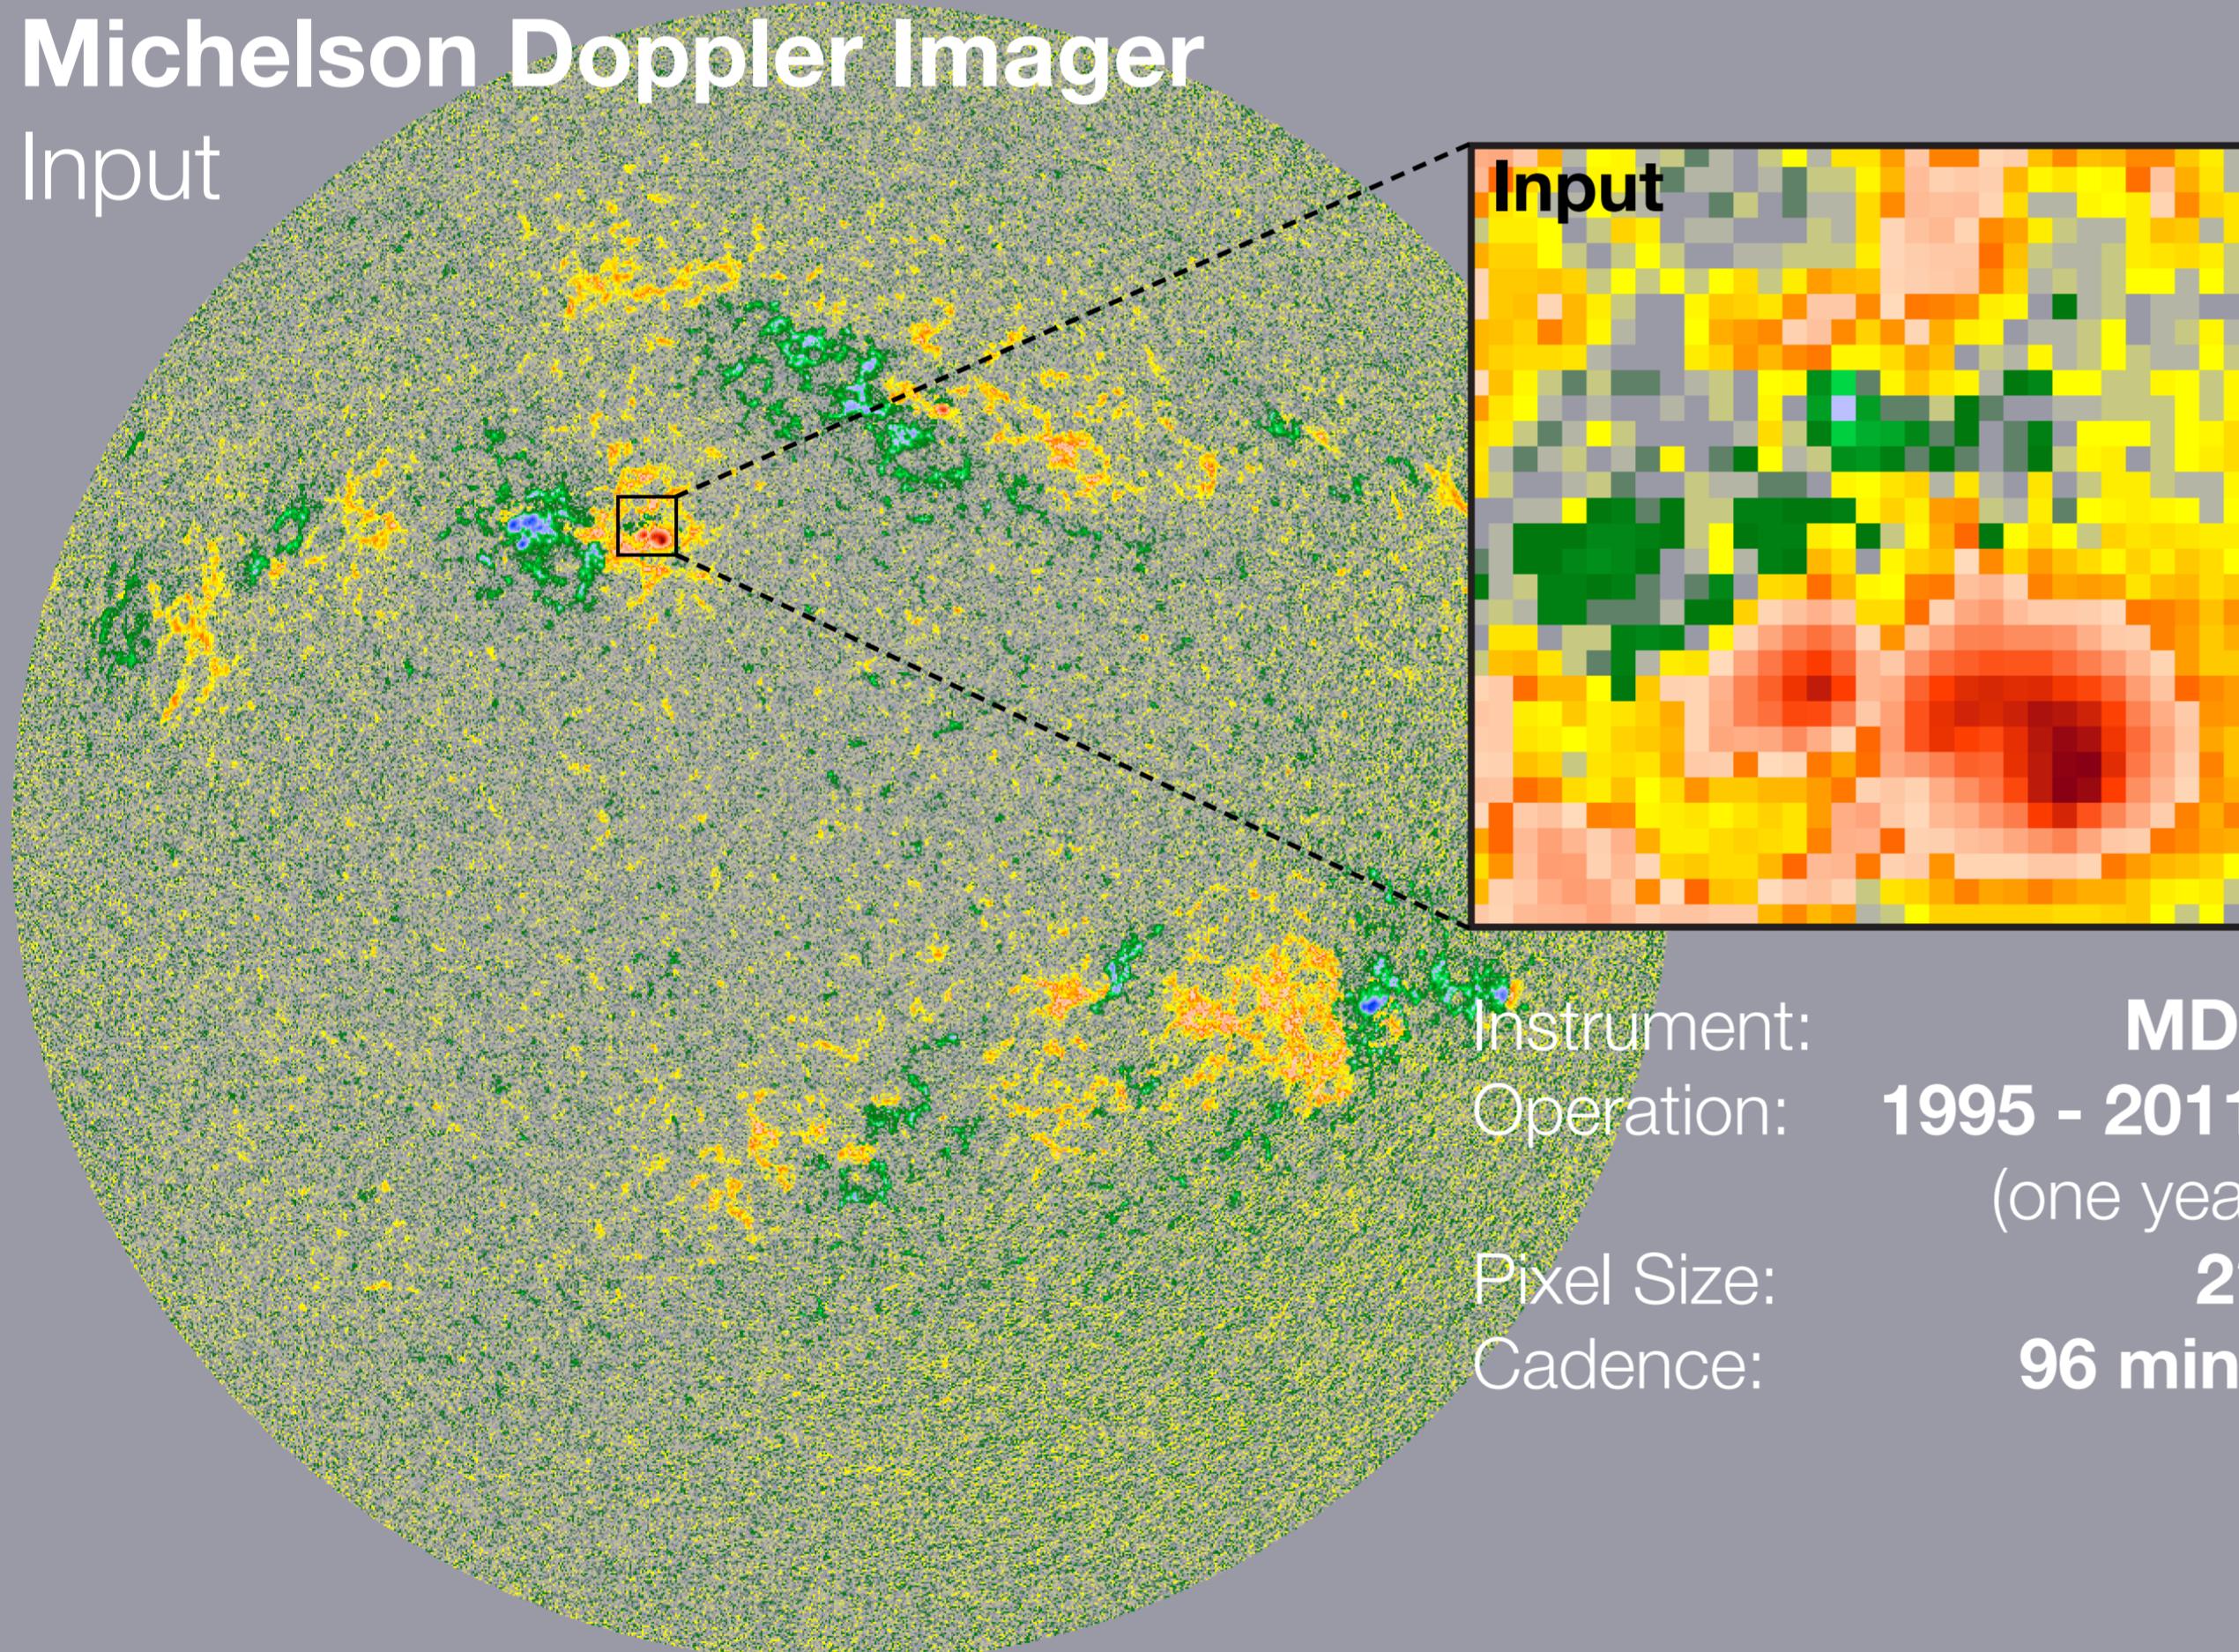

We use a Bayesian framework as in Kendall & Gal (2017) that decomposes uncertainty in to two components: **epistemic** (ignorance of the true data generating process), and **aleatoric** (the inherent noise). In practice, we implement this by adding Monte Carlo (MC) dropout in each convolutional layer, and track both the mean and variance of the magnetic field values.

e Conclusions & Future Work

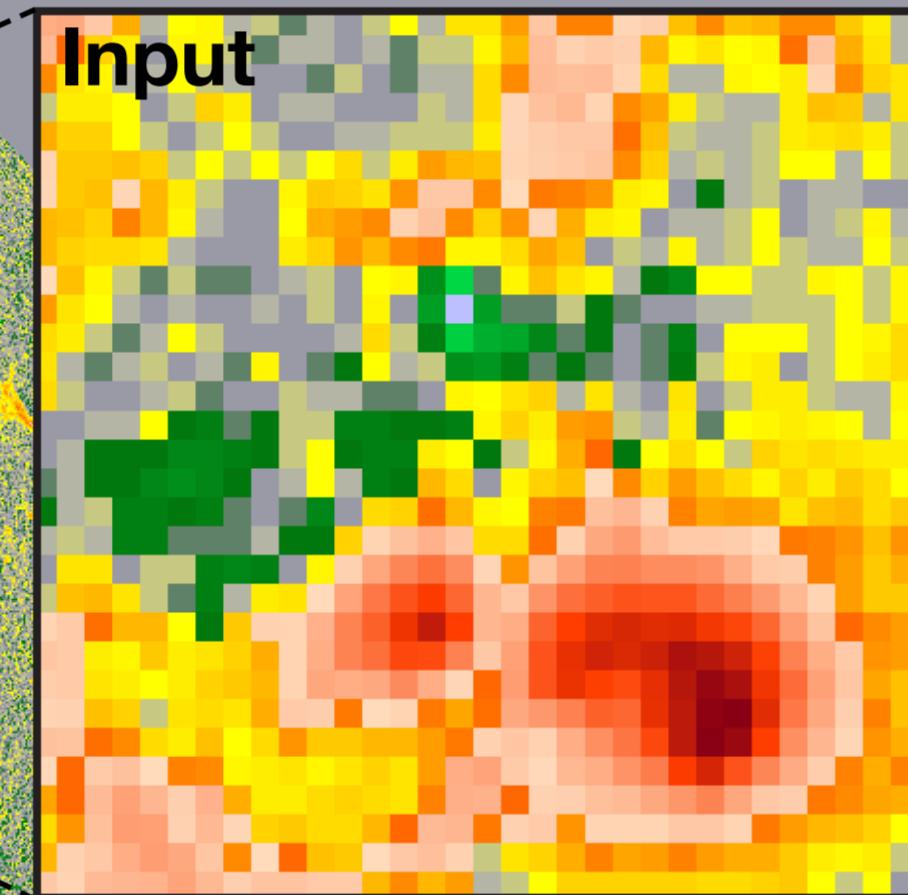

- To our knowledge, this is the first application of Bayesian Neural Networks to a super-resolution problem.
- Earlier versions of this work were published in workshops at NeurIPS 2019 (Gitiux et al 2019, arxiv: [1911.01486](https://arxiv.org/abs/1911.01486); Jungbluth et al 2019, arxiv: [1911.01490](https://arxiv.org/abs/1911.01490)).
- Shortly, we will provide test users with the super-resolution output to understand the suitability for various science tasks.
